

HW #2

תאריך הגשה 19.1.18 יום שישי בשעה 16:00

הגשה באיחור – כל יום איחור יוריד 5 נקודות מציון התרגיל – אנא הגישו בזמן

ניתן להגיש לבד או בזוגות. אם עבדת בזוג – לציין בקובץ וורד עם מי עבדתם.

- יש להגיש קובץ וורד המתאר בקצרה את התהליך בקוד ואת התוצאות.
- יש להגיש את קובץ הנתונים איתו עבדתם, אפשר להשתמש בקובץ שאעלה לתיקיה.
 - יש להגיש את קובצ/י מטלב. •
- 1. Read Sections I and II of the paper An ensemble approach for feature selection of Cyber Attack

 Dataset to understand the gathered data. The paper is under the HW folder.
- 2. Prepare a data set:
 - Data go to KDD Cup 1999 Data Data Set in UCI and download kddcup.data 10 percent.gz from the data folder.
 - This file is too long.. randomly erase rows of data. Keep about 10,000 rows.

Check that the last column contains some **normal** rows and some **attack** rows.

- For this HW, in the last column: replace normal with 0, replace all other values with 1.
- Erase columns 2 and 3 and 4 that contain categorical values for the protocol_type (tcp, udp..), service (http, smtp...) and flags (SF, SO, ..).
- You should end up with a data set that has 10000 rows, 37 feature columns and 1 binary label column. Instead, you can use the file I uploaded.
- 3. Separate the data into train and test by using a 5-fold cross validation procedure

- 4. Use PCA to project the train data:
 - Normalize the train data and save the means and variance.
 - Apply matlab's *pca* function.
 - Plot the eigenvalues and decide how many coordinates to keep.
 - Generate 2 or 3 plots using *figure; scatter3*(....) . color the dots by the value of their label. (plot for example [Z(:,1), Z(:,2), Z(:,3)], [Z(:,2), Z(:,3), Z(:,4)], [Z(:,5), Z(:,6), Z(:,7)]).
- 5. Project the test data onto the first PC's:
 - Normalize the test data.
 - Use the matrix W (output of *princomp*) to project the test data.

- 6. Use Logistic regression to classify the projected data into **normal vs. attack.**
- 7. Use SVM to classify the projected data into normal vs. attack.
 - Use *symtrain* on the projected train data.
 - Use *svmclassify* to classify the projected test data.

Optional: Repeat with Kernel SVM (choose one kernel)

8. Compute the correct classification (confusion matrix) for the Logistic regression and the sym classifiers.

Good Luck!
